

SHALEM NALLI

Frontend-Focused Full-Stack & AI Engineer

+91 9958264114 · shalemn0@gmail.com · linkedin.com/in/shalemnalli · github.com/shalemn4 · [portfolio](#)

PROFILE

Full-stack engineer who embeds directly with customers, scopes workflows from the factory floor, and ships production-grade software end-to-end from API design and database schema to React/Vue UI, observability, and documentation. I've built AI agent systems with function calling, multi-agent orchestration, and LLM evals; designed and maintained reusable design systems, SDKs, and component libraries; and iterated fast on real user feedback. I code in Cursor, design in Figma and Framer, and deploy on GCP and AWS. Comfortable working in agile/Scrum teams alongside subject-matter experts, Looking to own outcomes, not just close tickets.

EXPERIENCE

Full-Stack & AI Engineer – Freelance (Forward-Deployed)

Feb 2026 – Present

- ▶ Embedded directly with 5+ clients to scope workflows, map success criteria, and ship production-grade software on their infrastructure end-to-end from API design and database schema to React UI, deployment, and knowledge transfer.
- ▶ Built and maintained reusable design systems and component libraries (React + Tailwind + TypeScript), reducing future development effort by 40% and improving frontend performance by 25% through optimised state management and lazy-loading.
- ▶ Integrated enterprise-grade authentication (JWT, RBAC, session management) and third-party APIs across multiple client stacks; improved development efficiency by 30% through reusable adapter patterns.
- ▶ Contributed to Aden Hive, an open-source AI agent platform — shipped frontend enhancements and fixed bugs in the agent workflow interface, gaining hands-on experience with how agents consume and navigate UI-driven APIs.
- ▶ Instrumented services with structured logging and error tracking; wrote runbooks and component documentation enabling client teams to onboard and operate independently.

Frontend Engineer – BagYo

Nov 2025 – Feb 2026

- ▶ Contributed to the development of the BagYo logistics platform using Vue.js and TypeScript, collaborating directly with the founding team to translate product requirements into shipped features.
- ▶ Implemented end-to-end authentication workflows (login, session management, role-based access) and integrated backend APIs to power core dashboard functionality, ensuring secure and reliable data flow between frontend and backend.
- ▶ Built and maintained 10+ reusable UI components across the dashboard and platform views, establishing a scalable frontend architecture that reduced duplication and sped up future feature development.
- ▶ Worked cross-functionally with the BagYo team to debug and refine dashboard features, iterating based on direct product feedback to improve usability and reliability.

Frontend Developer – Linchpin Organization

Dec 2023 – Nov 2025

- ▶ Led frontend development of the organisation website; improved UX and mobile responsiveness by 35% translated Figma mock-ups to production-ready interfaces with 95% design accuracy.
- ▶ Built and maintained a reusable design system of 20+ React components still in active production use reducing future development effort by 40% and enabling contributors to onboard without assistance.
- ▶ Collaborated with cross-functional teams to deliver production-ready features within deadlines; documented component usage, design decisions, and integration guides for long-term maintainability.

Web Development Intern – Madadgaar Foundation

Jul 2023 – Sep 2023

- ▶ Developed responsive web pages improving mobile compatibility by 30% converted Figma mock-ups to functional interfaces with 95% design accuracy.
- ▶ Assisted in debugging and frontend optimisation, reducing reported frontend issues by 20%.

PROJECTS

Ledger AI - Auditable AI Workspace [Live link](#)

2026

- ▶ Took Ledger AI from 0 to production: scoped the product, designed the information architecture, built the full workspace UI in Next.js + TypeScript + Tailwind, and iterated based on user feedback.
- ▶ Built a multi-agent pipeline (Planner → Knowledge → Builder → Verifier) with structured outputs and function calling each agent owns a discrete phase and exposes its rationale and confidence score to the user.
- ▶ Built a RAG retrieval pipeline with pgvector embeddings and cross-encoder reranking, and an automated eval harness (RAGAS) scoring retrieval quality, answer faithfulness, and citation accuracy on every run.
- ▶ Implemented an interactive replay timeline with Zustand, allowing users to step through any run prompt, retrieved context, tool calls, output, and eval scores as an immutable, shareable evidence trace.
- ▶ Wrote technical documentation covering API contracts, agent integration guide, and architecture decisions structured for a FastAPI + PostgreSQL + pgvector production backend.

SheildIQ - Human Risk Intelligence [Live link](#)

2026

- Architected and built ShieldIQ, a production-style B2B SaaS platform for phishing simulation campaigns, employee security awareness tracking, and behavioral risk scoring using SvelteKit and TypeScript.
- Developed a multi-tenant application with RBAC, campaign management workflows, employee intelligence dashboards, audit logging, and executive security posture analytics.
- Designed a weighted human-risk engine and advanced analytics layer to generate employee risk scores, department-level vulnerability insights, risk heatmaps, and predictive security recommendations.
- Designed cloud-native backend architecture using Go, PostgreSQL, DynamoDB, SQS, SNS, OpenSearch, and Terraform, documenting event-driven processing pipelines and scalable SaaS deployment patterns.

CloudHunt - Cloud Incident Investigation Studio ([Live link](#) ,2026)

- Took CloudHunt from 0 to a deployed, production-grade DFIR workbench for SOC analysts and threat hunters, built end-to-end in SvelteKit 5 with Runes-based state management (\$state, \$derived, \$props) and TypeScript.
- Shipped a full multi-cloud log normalization engine supporting AWS CloudTrail/GuardDuty, Azure Activity Logs, and GCP Audit Logs, with automated IOC extraction and correlation against threat-intel feeds.
- Built an interactive MITRE ATT&CK Cloud Matrix heatmap, a Cytoscape.js threat-graph visualizer for blast-radius and lateral-movement analysis, and a cryptographically verified evidence locker for chain-of-custody storage.

AutoLife AI - Smart Daily Automation System (GCP) [Github link](#)

2026

- Scoped, architected, and shipped AutoLife AI from 0 to production designed the data-rich dashboard UI in Figma, built with React + FastAPI + PostgreSQL, and deployed on GCP iterated on two post-launch improvements based on early user feedback.
- Built agent-callable task routing APIs with structured outputs and function calling enabling LLM agents to autonomously schedule and manage tasks, reducing manual effort by 40%.
- Implemented multi-agent workflow orchestration with intelligent routing logic (each agent owns a discrete task domain) improved automation accuracy by 30% and added eval harness to measure prompt and tool reliability.
- Deployed containerised services (Docker) on GCP set up CI/CD pipeline with GitHub Actions, structured logging, and latency monitoring across agent workflows.
- Wrote technical documentation covering API contracts, agent integration guide, architecture decisions, and deployment runbook designed to be readable by both humans and machines.
- Recognised with a Google Cloud certificate for infrastructure and AI services design.

Aether - 3D Digital Workspace (SaaS) [Github link](#)

2025

- Took Aether from 0 to production-ready SaaS scoped the product, designed scalable REST APIs, built the React frontend from Figma designs, and shipped secure multi-user workspace management.
- Built enterprise-grade auth with JWT, RBAC, and session management optimised state management and data fetching strategies (PostgreSQL + Zustand), reducing load times by 25%.
- Gathered user feedback post-launch and shipped two iterative improvements within the first month wrote a short post-launch retro documenting what broke and how it was fixed.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, SQL, Bash

Frontend: React, Next.js, Vue.js (Pinia, Vite), Tailwind CSS, HTML5, CSS3, Zustand, Responsive Design

Design & Dev Tools: Figma, Framer, Cursor (AI-first IDE)

Backend: Node.js, Express.js, FastAPI (Pydantic, SQLAlchemy, Asyncio), Python, Django (familiar), Go (familiar), C#, Java

Databases: PostgreSQL, MongoDB, MySQL

Infrastructure: Docker, Kubernetes (familiar), Terraform (familiar), AWS S3, GCP, GitHub Actions, CI/CD

Observability: Structured Logging, GCP Cloud Logging, Latency Monitoring, Error Tracking

Integration & Auth: REST, GraphQL, JWT, RBAC, OAuth, SSO/OIDC (familiar), SAML (familiar)

AI & LLMs: OpenAI API, Google GenAI, Function Calling, Multi-Agent Orchestration, MCP Servers, RAG, LLM Evals, Structured Outputs, Prompt Engineering

CERTIFICATIONS

Google Cloud Certificate - Google Cloud / AutoLife AI Project

2026

Full Stack MERN Certificate – Acmegrade

2023

EDUCATION

Bachelor of Computer Applications

Presidency University, Bengaluru

Sep 2022 – Sep 2025
